SINCE AI 2026 · BAYER CHALLENGE

Build less.
Trust what remains.

SMART LIBRARIAN

From a business question to a governed report —
without creating the next duplicate.

THE PROBLEM

AI can accelerate the wrong thing.

More requests → More dashboards → More duplicated logic

Which KPI is right?

Who owns this?

Can we safely retire it?

Du
Ta
to-
BI
mi
cre
alo
no
wi

OUR RESPONSE

Reuse before you create.

01

Reuse exact approved scope

02

Make ownership explicit

03

Keep evidence with the output

AI proposes intent. People confirm responsibility. Deterministic checks govern the result.

MEANINGFUL AI, BOUNDED AUTHORITY

Let AI interpret. Never let it silently decide.

LLM PROPOSES

- Products
- markets
- fields
- periods

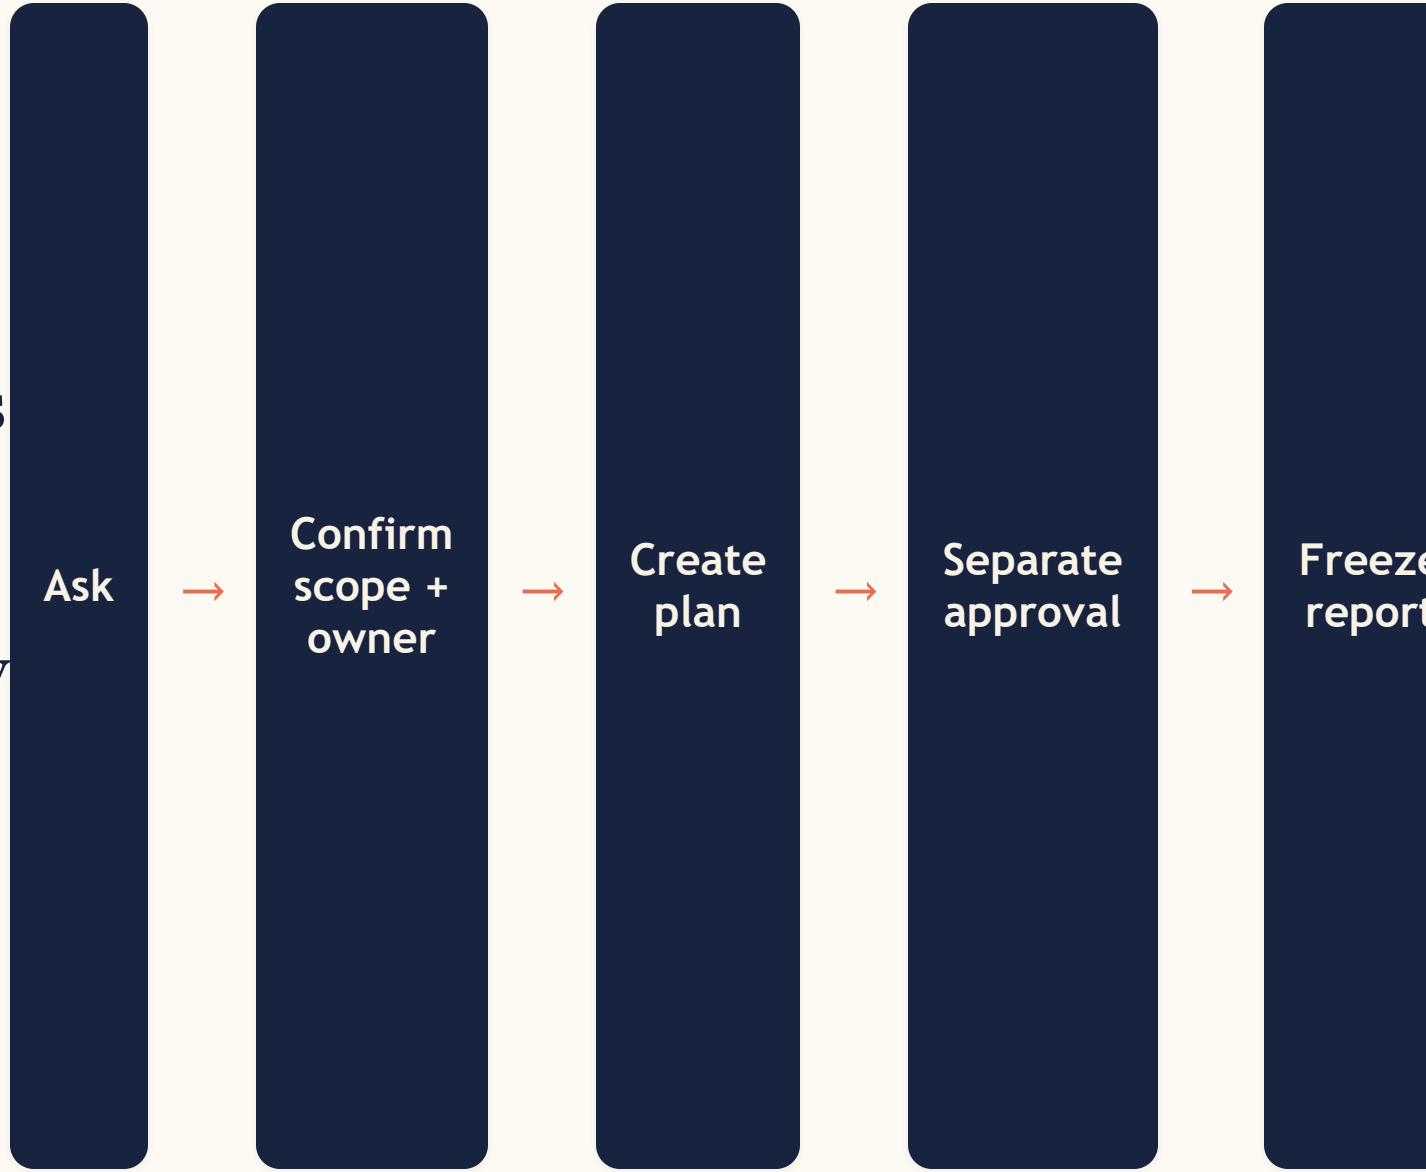

GOVERNED WORKFLOW CONTROLS

- Validate choices
- confirm scope
- choose owner
- separate approval

LIVE DEMO

One question. An accountable answer.

"Show monthly Nubeqa net sales and sales forecast in Germany for January through March 2026."

THE REVEAL

The second request should not create a second report.

REUSE

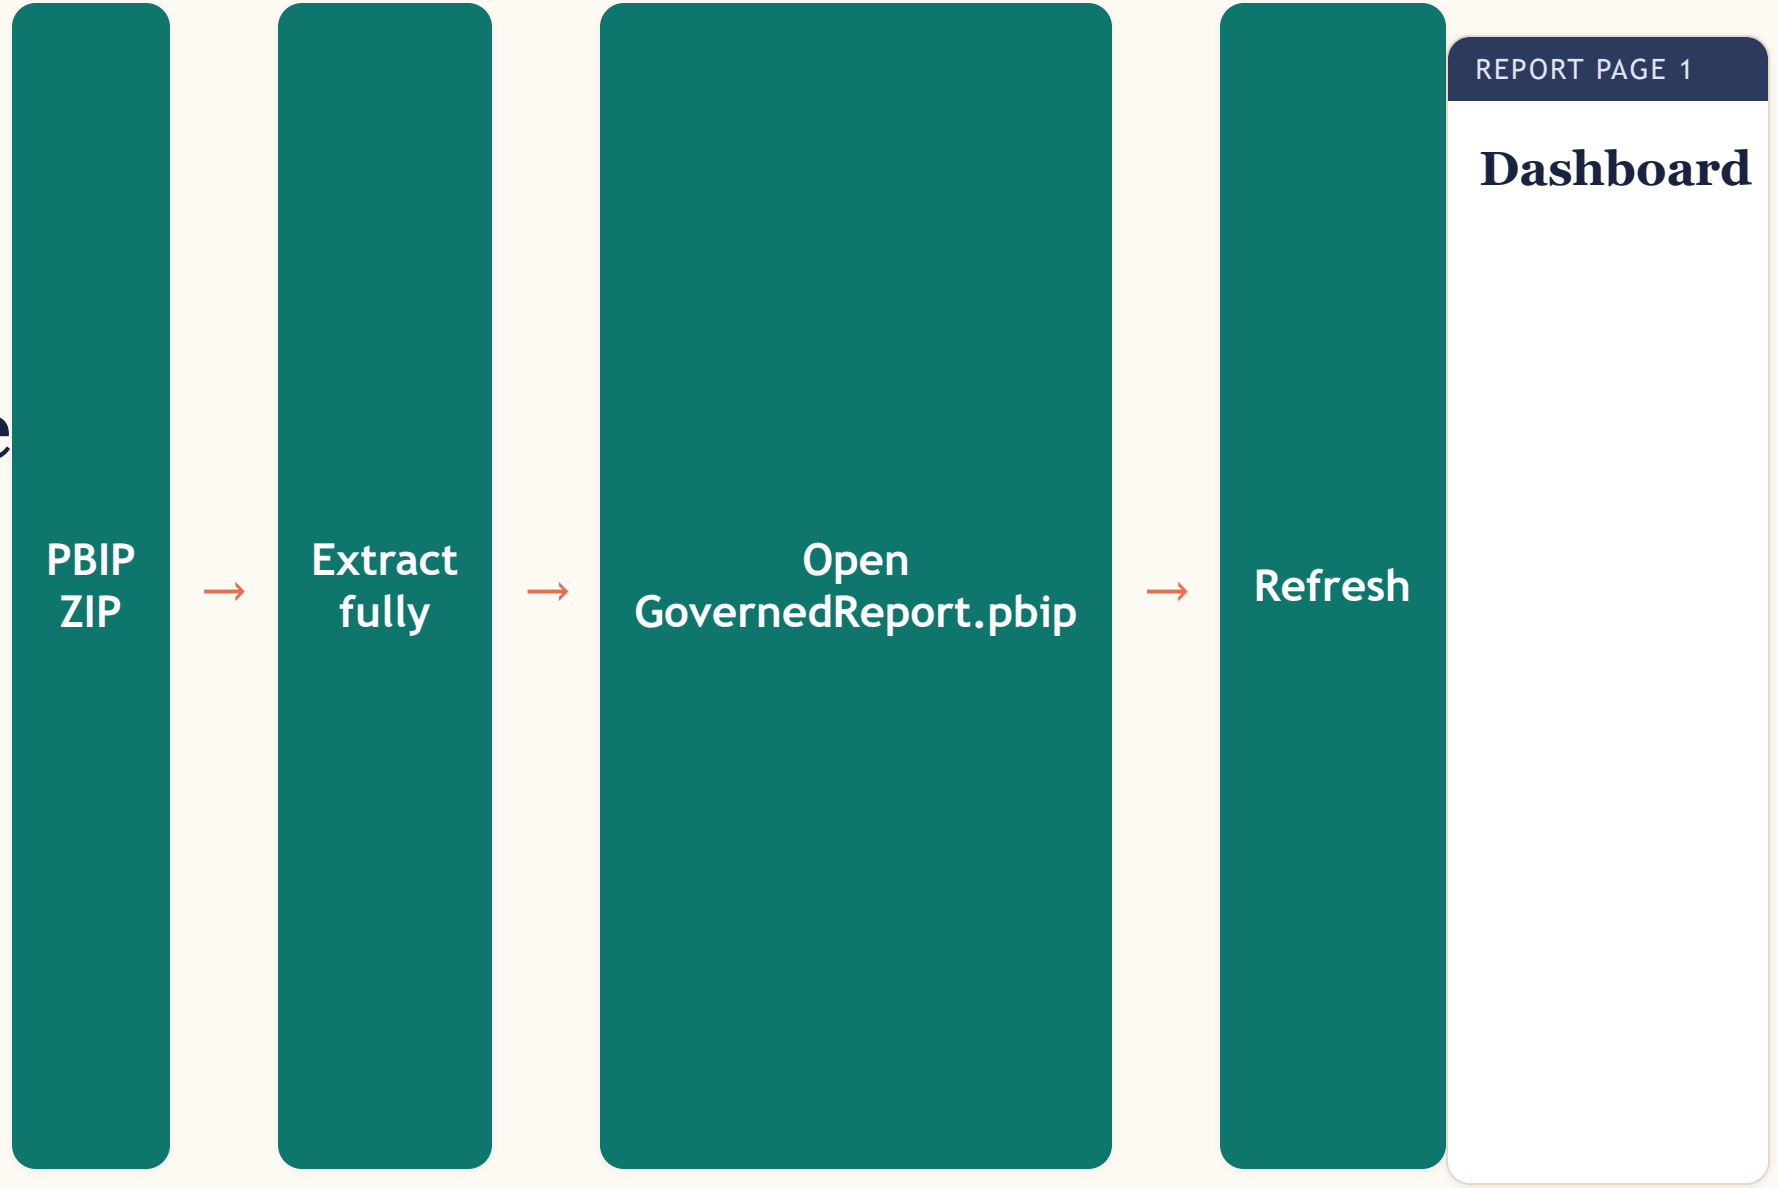

Same confirmed scope + same owner + same source fingerprint → existing approved plan

Reorder the same fields → same plan

Remove a field → different scope

POWER BI HANDOFF

The report travels. Its evidence travels with it.

ONE CONTROL PATTERN, FOUR DOMAINS

Different questions. The same discipline.

Commercial

MONTHLY

Net sales + forecast

Supply

SNAPSHOT

OTIF + inventory + risk

Market Access

SNAPSHOT

Coverage + reimbursement

Launch

EVENTS

Milestones + status

BEYOND CREATION

An analytics estate needs an exit strategy.

Review reuse candidates

Propose migration

Propose consolidation or retirement

Owner

KPI catalog

Usage

Dependencies

Governance signals

Approved proposal ≠ executed change

PROOF, NOT PROMISE

A working prototype. Clear evidence boundaries.

Prior local end-to-end checks

Four-domain approval, frozen render, exports, REUSE and Power BI page checks.

Separate Snowflake checks

Four-domain live intent extraction verified on 7 November 2026.

The complete end-to-end checks used an earlier provider. A complete Snowflake end-to-end pass is not claimed by those checks.

PATH TO ENTERPRISE

Scale the control plane, not the dashboard count.

WORKING LOCALLY

- Confirmed specifications
- persisted plans
- frozen exports
- audit events

NEXT INTEGRATIONS

- Enterprise identity
- managed registry
- approved BI deployment
- certified semantic bindings

The best new dashboard might be the one we never create.

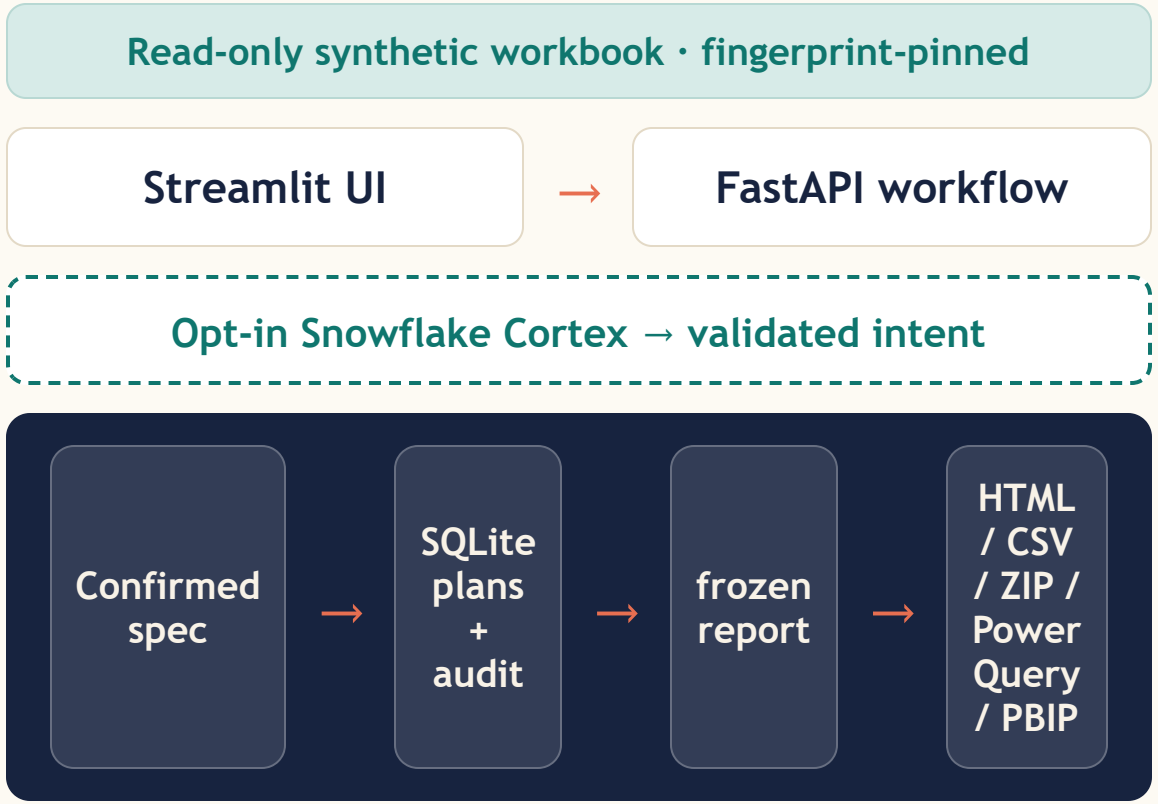

The intended business outcome — not a measured impact claim.

Build less. Build better. Govern by design.

APPENDIX · ARCHITECTURE

APPENDIX

A thin AI layer. An explicit governance spine.

APPENDIX

Where we draw the line.

two dashboards are equivalent?

No. It matches confirmed scope, owner and source fingerprint.

Are KPI definitions certified executable logic?

No. Catalog context is distinct from semantic bindings.

Can AI approve or calculate the report?

No. Separate simulated approval; deterministic source-row rendering.

Does a successful export prove Desktop works?

No. Open, Refresh and inspect all three

Power BI service publishing.
